P. 5 Lines 6 to 9

A space 13 is formed in the central part of in-between an above described base member 4 and a supporting member 2, and an elastic member 3 formed of a countersink spring is disposed in this space 13.

P. 8 Lines 8 to 10

A crane structured as above described lifts up a cargo A with a lifter 9 in a condition of which a body 1 is established by putting a supporting member 2 against an establishing surface B. In this case, a supporting member 2 abuts against an above described base member 4 opposing the spring force of the elastic member 3, thus, a load on the body 1 is well supported by the supporting member 2 and the base member 4.
